SUMMARY

Kohinoor Chemical Company (Bangladesh) Limited (DSE: KOHINOOR) is an enterprise which manufactures soaps, cosmetics, and toiletries and is affiliated to Orion Group, based in the Tejgaon Industrial Area, Dhaka. It is one of the oldest manufacturers in this sector in Bangladesh having been established in 1956 and is famous for its Tibet range of products in addition to other product ranges like Sandalina, Fast Wash, and Ice Cool. Kohinoor Chemical Company (Bangladesh) Limited became a public limited company in 1988 and listed itself on DSE with the stock code KOHINOOR.

CAPABILITY OF MEETING FUTURE MARKET DEMAND

The GDP growth of Bangladesh has decreased over a short period of time: in October 2025, the IMF revised its FY26 GDP growth forecast to 4.9% from 6.5% (in April 2025), a number that is in line with the estimates provided by the World Bank, at 4.8%, and the Asian Development Bank, at 5%. Despite lower growth rates, economic development should ensure that the GDP and income of people remain high enough to be able to buy branded personal care and FMCG goods. The company is capable of meeting such demand as, for FY25 (July 2024-June 2025), the company earned ₳6.47 billion (+11.76%) and net profits of Tk63.20 crore (+24%), and the board of directors decided to pay out 75% dividends (65% cash and 10% in stocks).

BUSINESS STRATEGY ALIGNED WITH CONSUMER DEMAND

The basic idea behind the strategy at Kohinoor Chemical Company can be seen in the soap range of products including Tibet, Sandalina, and Bactrol. The reason for this range of products being successful is because of the increased realization about hygiene due to the coronavirus pandemic. According to Jago News' reports (August 2026), a company director said that soap still is one of the most profitable business sectors of Kohinoor. Moreover, the reporting states that there is an overall trend in the industry where retailers say customers who used to buy foreign brands such as Fa, Imperial Leather, and Dove are now switching to the local brands, including Kohinoor because of quality improvement. Other than soaps, the company has expanded its line of products to include skin-care products, toothpaste, fabric-care products, hair oils, and dishwashing liquids.

RECENT NEWS

The company's growth has carried on till FY26; the trailing twelve months' data as of mid-August 2026 reveal that the company had generated ₳7.08 billion in revenue and ₳709.01 million in profit, outperforming its FY25 figures of ₳6.47 billion and ₳632 million (for the period July 2024 – June 2025). The performance of the firm is remarkable, with its stock having increased by 18.76% in the last 52 weeks until mid-August 2026. In addition, the firm has been renamed "Kohinoor Chemical Company (Bangladesh) Ltd." to "Kohinoor Chemical Co. (Bangladesh) PLC" in June 2026. The firm has rewarded its stakeholders as profit has increased. In FY25, the board of directors announced a dividend payout of 75% (65% cash + 10% stock), compared to 60% (50% cash + 10% stock) the previous year. After a 1.1 forward stock split that was announced on November 23, 2025, the shareholders got a cash dividend of ₳6.50 per share, paid January 6, 2026.

MACROECONOMICS

Economic Growth

There have been reductions in economic growth for Bangladesh in three consecutive years. The World Bank estimates that FY26 will record 3.9% growth, the ADB estimates 4.0%, while the IMF estimates 4.7% - the higher figure being attributed to the expectation of increased private investment and public capital expenditure before the 2026 national elections. Although there is an easing of growth, the foreign exchange environment has proved to be quite resilient, with remittances rising 27.6% and exports rising 11% such that the current account surplus is now \$149 million compared to a deficit of \$6.6 billion recorded in FY24 - the first surplus recorded in eight years. In terms of foreign exchange reserves, the low of \$18.6 billion in 2024 has risen to an estimated level of \$31-\$36 billion. Inflation is the major constraint to economic growth with point-to-point inflation being 9.16% in June 2026.

Disposable Personal Income

The nominal GDP per capita is forecasted to be around \$2,960 in 2026, up from \$2,800 in 2022 – steady, albeit slowing, growth in income levels of households. Higher incomes, even if growing at a slower rate, would eventually help in increasing demand for brand-name personal care and FMCG products including Kohinoor's soap and other product lines.

Impact of Inflation on Buying Power

Inflation has continued to impact the real spending power of households. While food inflation has come down from a high of 13.8% in 2025 to 7.4%, due to an improvement in supply situation, non-food inflation continues to hover stubbornly around 9%. While personal care and household staples tend to display inelastic demand when compared with discretionary FMCG products during times of inflation, sustained non-food inflation puts a constraint on price flexibility for companies like Kohinoor.

Consumer Goods Industry Overview — Bangladesh

Bangladesh's fast-moving consumer goods (FMCG) sector, encompassing soap, detergents, cosmetics, toiletries, and household care products, is one of the country's most dynamic non-apparel manufacturing industries. Industry insiders estimate the overall FMCG market at approximately Tk 50,000 crore annually, of which toiletries and cosmetics alone account for roughly Tk 25,000 crore, with the category growing at around 5% per year in value terms (The Daily Star, 2025a).

Personal care and cosmetics specifically have expanded rapidly: the segment was valued at more than US\$1 billion in 2020 and is projected to surpass US\$2 billion by 2027, driven by rising grooming and hygiene awareness among the growing urban and rural middle class (Allied Market Research, as cited in The Business Standard, 2024). Within sub-segments, the shampoo market alone is estimated at US\$146.45 million in 2024 and is forecast to reach US\$261.82 million by 2029, a CAGR of about 12.3% (Mordor Intelligence, 2024). The broader toiletries and cosmetics industry has grown at a compound annual growth rate (CAGR) of roughly 10% over the preceding decade and a half (Priti Research, 2025).

The industry is structurally split between multinational corporations (MNCs) and local manufacturers. Multinational and foreign brands, led by Unilever Bangladesh, currently hold approximately 70% of the cosmetics and toiletries market, while local manufacturers — including Kohinoor Chemical, Square Toiletries, Keya Cosmetics, ACI, and others — hold the remaining 30% (The Daily Star, 2025a). This local share has grown steadily from roughly 40% in the late 1990s to about 60% of the broader toiletries category when soap and detergent are included, reflecting improving local manufacturing quality, GMP adoption, and brand trust (Priti Research, 2025). Fragrant/beauty soap alone is estimated at around Tk 3,500 crore, with domestic brands — Kohinoor's Tibet and Sandalina, Square's Meril, ACI's Savlon, Keya, and others — expanding rapidly against Unilever's Lux and Lifebuoy (Jagonews24, 2025).

The industry remains import-dependent for raw materials: approximately 90% of the chemicals, fragrances, and active ingredients used in local manufacturing are imported, chiefly from China and India for cost efficiency, and from the UK, US, Germany, France, and other markets for premium formulations (Priti Research, 2025). This exposes manufacturers, including Kohinoor,

to currency and international commodity-price risk even though finished-goods sales are almost entirely domestic.

Domestic Market Overview

Bangladesh is projected to become the ninth-largest consumer market globally by 2030, supported by sustained GDP growth, rising disposable incomes, and a large, youthful population (The Business Standard, 2024). Domestic consumption continues to represent over 66% of GDP even amid post-2022 inflationary pressure, underscoring the resilience of consumer-facing sectors such as FMCG (The Business Standard, 2024).

Distribution in Bangladesh remains predominantly a traditional, high-density retail network of small neighbourhood and rural shops (mudi/general stores), supplemented by a fast-growing modern retail and e-commerce channel. E-grocery and e-commerce platforms (e.g., Chaldaal, Meena Click, Panda Mart) are expanding rapidly on the back of rising smartphone penetration, which rose from about 31% (45 million users) in 2017 and is projected to reach roughly 75% (138 million users) by 2025, improving product accessibility and demand generation (Invest Bangladesh, n.d.).

Household-level FMCG categories such as hygiene and home-care products (comparable to Dettol, Savlon, Lifebuoy) constituted a market of over US\$100 million in 2023 and industry participants expect this to roughly double over five to six years as household penetration deepens, particularly outside metropolitan areas (The Business Standard, 2024). Public hygiene awareness, which rose sharply during the COVID-19 pandemic, has had a lasting effect on soap and handwash consumption in both urban and rural Bangladesh (Jagonews24, 2025).

Import substitution is an important dynamic in the domestic market. A 20% regulatory duty imposed on imported personal-care items in May 2022 caused import volumes to fall by roughly 50% by early 2023, accelerating the shift of demand toward domestically manufactured alternatives — a trend that has directly benefited established local producers such as Kohinoor Chemical (The Business Standard, 2024).

Demography Overview:

Bangladesh's demographic profile underpins long-run demand for consumer goods. The population reached approximately 175–176 million in 2025 and continues to grow, though at a decelerating rate as fertility approaches replacement level ($TFR \approx 2.1\text{--}2.3$) (UNFPA Bangladesh, 2026; Worldometer, 2026). The country is in an advanced stage of demographic transition: the working-age population (15–59 years) constitutes about 62% of the total, and the median age is

roughly 26–27 years, giving Bangladesh a substantial and youthful consumer base entering peak earning and spending years (UNFPA Bangladesh, 2026).

Urbanization is accelerating, with the urban share of the population rising from around 32% in 2022 toward an estimated 43% by 2026, a trend that supports demand for branded, packaged personal-care and home-care products over unbranded or informal alternatives (Worldometer, 2026; UNFPA Bangladesh, 2026).

The middle-class and affluent consumer (MAC) segment — the primary target for branded FMCG — is expanding quickly. Middle-class Bangladeshis (per-capita income of US\$2–3/day) represented roughly one-fifth of the population and are projected to reach approximately 25% (about 44 million people) by 2025 and 33% (about 60 million people) by 2030 (The Daily Star, 2024). This aligns with earlier Boston Consulting Group projections that MAC consumers would rise to about 17% of the population by 2025, spreading beyond Dhaka and Chittagong into dozens of secondary cities (World Economic Forum, 2015). For a company such as Kohinoor, whose brands are positioned toward middle-income and rural consumers (Wikipedia, n.d.-a), this demographic shift represents both an opportunity (a widening addressable base) and a competitive risk, as rising incomes can also draw consumers toward premium multinational brands.

Market Share:

Market-share estimates for Kohinoor Chemical vary by data source and product category, reflecting the FMCG industry's fragmented reporting, but converge on Kohinoor being one of the two or three largest domestic manufacturers of soap, cosmetics, and toiletries in Bangladesh.

Source / Basis	Leading Player(s)	Kohinoor's Position
Soap category (Bangladesh Bureau of Statistics survey, cited in Scribd, n.d.)	Unilever – 45%	Kohinoor – 20% (2nd largest); Square – 18%; Keya – 13%
Overall soap market (Wikipedia, n.d.-a)	Unilever Bangladesh – ~50%	Kohinoor – 2nd largest national share
FMCG revenue basis (Finpedia, 2022)	Marico – largest	Kohinoor – ~11.5% (4th, after Marico, Keya, Reckitt Benckiser BD)
Cosmetics/toiletries industry overall (Scribd, n.d.)	Unilever, Kohinoor, Square, Keya combined	Top 4 local/MNC players hold >95% of the market

Kohinoor's flagship Tibet brand — spanning soap, snow/cream, talcum, and related toiletries — has historically been the company's principal share driver, particularly among middle-income and rural households, where it is described as competing directly with Unilever's Lux and Sunsilk despite Kohinoor's smaller marketing budget (Scribd, n.d.). The company's second core brand, Sandalina, has repeatedly ranked among Bangladesh's top consumer brands (Finpedia, 2022). Kohinoor's market position is comparatively weaker in newer or MNC-dominated categories such as shampoo, premium skincare, and oral care, where multinational and larger domestic rivals (Unilever, Square Toiletries, Marico, ACI) hold stronger share.

Export:

Kohinoor Chemical is overwhelmingly a domestic-market business; company disclosures describe its operations as serving "the consumer goods market within and outside the territory of Bangladesh" through three product lines — toiletries, cosmetics, and miscellaneous products — but exports form a minor share of total turnover relative to domestic sales (PitchBook, 2025). Historically, the company has maintained an Export Division tasked with pursuing regional and overseas markets and participating in international trade fairs, part of a wider modernisation (BMRE) programme undertaken after privatisation in 1993 (Lawyers & Jurists, n.d.).

More broadly, Bangladesh's toiletries and cosmetics exports remain small relative to the country's dominant apparel (RMG) export base; the sector's current external sales are largely confined to tea, processed foods, and toiletries, though government and industry bodies view FMCG as having meaningful untapped export potential if supported by appropriate trade and industrial policy (Invest Bangladesh, n.d.). It is notable that a separately owned, similarly named company — Kohinoor Chemical Co. (Pvt) Ltd. of Karachi, Pakistan, also using the heritage "Tibet" brand — operates independently of the Bangladeshi entity and should not be conflated with KCCL's export activity (Kohinoor Chemical Co. Pvt Ltd, n.d.).

Given the ongoing 90% import-dependency for raw chemicals used in domestic manufacturing (Priti Research, 2025), Kohinoor's net foreign-exchange position is shaped more by import costs than by export receipts, making the taka's exchange rate and import-duty policy more material to margins than export volumes.

Business Overview:

Kohinoor Chemical Company (Bangladesh) PLC (KCCL) is the oldest soap, cosmetics, and toiletries manufacturer in Bangladesh, established in 1956 at the Tejgaon Industrial Area, Dhaka (Wikipedia, n.d.-a). Originally founded as Kohinoor Shilpa Gosti, the company was nationalised after independence and placed under the Bangladesh Chemical Industries Corporation (BCIC) before being privatised on 3 August 1993 (Lawyers & Jurists, n.d.; Finpedia, 2022). It was converted into a public limited company in 1988, listed on the Dhaka Stock Exchange (DSE) the same year, and on the Chittagong Stock Exchange (CSE) in 1996 (Kohinoor Chemical Company, n.d.).

KCCL is currently a subsidiary of Orion Group, a large diversified Bangladeshi conglomerate; Md. Rezaul Karim (also referenced as Md. Karim) serves as Managing Director/CEO (Wikipedia, n.d.-a; SimplyWall.St, 2026). The company's registered factory is located at Tejgaon I/A, Dhaka, with its corporate office at Orion House. As of its most recent public disclosures, KCCL employs roughly 2,900–3,000 people and has an authorised share capital of BDT 500 million against paid-up capital of BDT 222.0 million (Kohinoor Chemical Company, n.d.).

The company manufactures across three broad product lines: toiletries (the largest, contributing over 80% of historical revenue), cosmetics, and miscellaneous/household products (PitchBook, 2025; Finpedia, 2022). Its manufacturing capacity includes roughly 40 metric tons/day of toilet soap, 90 metric tons/day of washing soap, and 100 metric tons/day of detergent (Finpedia, 2022). Its brand portfolio includes Tibet (its flagship, spanning soap, snow/cream, talcum, and prickly-heat powder), Sandalina, Bactrol, Beautina, Fast Wash, Xpert, Clean Master, Ice Cool, Fruity, AM.PM, Genstar, and Wiper (Investing.com, n.d.; MarketScreener, n.d.).

Financially, KCCL reported revenue of approximately BDT 6.9 billion on a trailing basis with year-on-year revenue growth of roughly 28% and earnings growth of approximately 27.6%, alongside a return on equity near 10.2% (SimplyWall.St, 2026). This marks a substantial acceleration from BDT 4.17 billion in FY2020–21 (SimplyWall.St, 2026; Finpedia, 2022), reflecting both post-pandemic hygiene-driven demand and the benefit of import-substitution policy.

Business Strategies:

- **Focused Cost Leadership:**

Kohinoor's core competitive strategy is best characterised as focused cost leadership: the company prices its soaps, cosmetics, and toiletries below multinational competitors while targeting the large middle-income and rural consumer segment, where price sensitivity is highest (Scribd, n.d.). This has allowed Tibet-branded products to remain the preferred choice among cost-conscious households even as Unilever and other MNCs dominate premium urban segments.

- **Legacy Brand Equity and Trust:**

The company leverages nearly seven decades of brand history — Tibet has been in continuous production since the 1950s — to sustain consumer trust and habitual purchase behaviour, particularly in rural and semi-urban markets where brand switching is less frequent (Lawyers & Jurists, n.d.; Wikipedia, n.d.-a).

- **Distribution Network Expansion:**

Management has periodically reorganised its distribution system to extend Tibet products' reach nationwide, recognising that Bangladesh's FMCG market is won largely through the density and reliability of traditional retail distribution rather than through advertising alone (Lawyers & Jurists, n.d.).

- **Product Diversification and Modernisation (BMRE):**

KCCL has pursued balancing, modernisation, rehabilitation, and expansion (BMRE) of its manufacturing base, including technical collaboration with a European industrial partner, to upgrade production technology and introduce new product categories (e.g., dishwashing liquids, liquid toilet cleaners, and modern packaging formats) (Lawyers & Jurists, n.d.). The company has also progressively adopted Good Manufacturing Practice (GMP) standards, a response to both competitive pressure and the 2023 Drugs and Cosmetics Act (HPC-BD, n.d.).

- **Segmented Brand Targeting:**

Rather than a single mass-market approach, Kohinoor markets different brands to distinct demographic segments — for example, Sandalina sandal soap is positioned toward younger consumers (roughly ages 10–30), while detergent powder targets housewives and mothers as primary purchasers — allowing more precise marketing spend allocation (Finpedia, 2022).

- **Capitalising on Import-Substitution Policy:**

The company benefits from, and its strategy implicitly relies on, favourable trade policy: the 2022 regulatory duty on imported personal-care goods has structurally improved the relative price competitiveness of domestically manufactured toiletries, an environment in which Kohinoor's scale and cost base are well positioned (The Business Standard, 2024).

BCG Growth-Share Matrix:

- **Cash Cow: Soap (Tibet Luxury, Bath & Health Soap)**

Soap is Kohinoor's highest relative-share business, holding roughly 20% of the national soap market and ranking second only to Unilever (Scribd, n.d.; Wikipedia, n.d.-a). The category itself is mature, growing at a modest single-digit rate of roughly 5% annually (The Daily Star, 2025a), typical of an established FMCG staple. Soap generates the steady cash flow that funds Kohinoor's investment in other product lines and its ongoing BMRE modernisation programme.

- **Star: Skin Care & Cosmetics (Tibet Snow, Sandalina, Beautina)**

Kohinoor's cosmetics and skin-care lines combine strong, long-established brand leadership among its core middle-income/rural demographic with a fast-growing category: Bangladesh's overall personal-care and cosmetics market is expanding from roughly US\$1 billion (2020) toward over US\$2 billion by 2027 (The Business Standard, 2024). Sandalina and Tibet Snow have repeatedly ranked among the country's top consumer brands (Finpedia, 2022), positioning this segment as a high-share, high-growth Star warranting continued investment.

- **Question Marks: Oral Care and Home Care (AM.PM, Genstar; Xpert, Clean Master)**

Oral care (toothpaste) and home/household-care products sit in fast-growing categories — household FMCG such as hygiene and cleaning products is projected to roughly double over five to six years (The Business Standard, 2024) — but Kohinoor holds comparatively low share against dominant multinational players (e.g., Unilever's Pepsodent, Colgate-Palmolive in oral care; Reckitt Benckiser and others in home care) and larger diversified domestic rivals such as Marico and ACI (Finpedia, 2022). These lines require targeted investment and differentiation to convert growth-category exposure into share gains, or risk being deprioritised.

- **Dog: Fabric Care / Detergent (Fast Wash)**

Detergent powder is a large but low-growth, highly commoditised category in which Kohinoor's Fast Wash brand holds a comparatively small share against dominant players; company disclosures note that detergent-powder sales, alongside shaving cream and toilet soap in certain periods, have declined even as other product lines grew (Finpedia, 2022). With limited differentiation potential and low relative share in a low-growth category, this line fits the Dog quadrant and is a candidate for margin optimisation, selective repositioning, or reduced capital allocation rather than aggressive reinvestment.

Business Model Canvas

Key Partners

- Orion Group (parent conglomerate)
- Chemical/fragrance importers (China, India, UK, US, Germany, France)
- European technical partner (BMRE modernisation)
- Depots, warehouses, logistics providers

Key Activities

- Soap, cosmetics & toiletries manufacturing
- Product diversification (BMRE)
- Distribution network expansion
- GMP quality upgrades

Key Resources

- Brand portfolio: Tibet, Sandalina, Bactrol, Fast Wash
- Tejgaon plant (~230 MT/day combined capacity)
- ~2,900-3,000 employees
- Orion Group financial backing

Value Propositions

- Affordable, trusted personal-care staples for cost-conscious households
- 70-year heritage brand (Tibet) driving loyalty
- Cost leadership vs. multinational rivals
- Broad range: soap to detergents to skincare

Customer Relationship

- Habitual, trust-based repeat purchase
- Segmented brand targeting by age/role
- Quality-driven switching from foreign brands

Channels

- Desktop, Tablet, Mobile phone, app stores
- Social Media
- Website
- Direct Message
- Customer Support
- Delivery Man

Customer Segments

- Middle-income & rural households
- Price-sensitive mass market
- Younger consumers (Sandalina)
- Housewives/mothers (detergent)

Cost Structure

- Imported raw chemicals & fragrances (~90% import-dependent)
- Manufacturing & production costs
- Distribution & logistics
- BMRE modernisation capex

Revenue Stream

- Soap sales — Tibet, Bactrol (cash cow)
- Cosmetics/skincare — Sandalina, Beautina (star)
- Oral & home care — question marks
- Detergent — Fast Wash (dog); minor exports

FINANCIAL ANALYSIS

Financial Health

Solvency: Given financial leverage as the metric for analysis, the capital structure of Kohinoor has been shifting increasingly away from debts, as seen in the reduction in the ratio of financial leverage from 1.877 in 2023 to 1.456 in 2024 and further to 1.421 in 2025. The implication is that there is a rising proportion of assets financed through equity.

Asset Management & Asset Quality

Operating Efficiency

The **total asset turnover ratio** rose from 1.694 in 2023 to 1.815 in 2024 and further to 2.024 in 2025, meaning that there was greater efficiency in generating sales from assets in each succeeding year. In terms of **net fixed asset turnover**, the ratio has increased from 17.729 in 2023 to 21.633 in 2025. **The equity turnover ratio** has declined from 3.232 in 2023 to 2.908 in 2025. Together with the reduced leverage ratio, this indicates that the equity base is growing at a faster rate than sales. The latter is evidence that the firm is maintaining its equity and not borrowing to finance operations.

Efficiency & Productivity & Capital Strength

The **inventory turnover ratio** increased from 2.968 in 2023 to 3.426 in 2025, and the inventory turnover period decreased from 122.98 days in 2023 to 106.54 days in 2025.

Profitability & Investment Return

Profitability

Profits were increasing every year for all three years without any exceptions: the gross profit margin increased from 0.2218 (2023) to 0.2825 (2025), the operating profit margin increased from 0.0976 to 0.1356, and the net profit margin increased from 0.0704 to 0.0977. The return on equity increased from 0.2276 to 0.2841, and the return on assets increased from 0.1193 to 0.1977 during this time, which means that these increases in ROE and ROA are due to improved operations, not leverage, because financial leverage was

Growth Perspective

For the period from 2023 to 2025, Kohinoor has done better on all the ratios mentioned above; margins, efficiency, liquidity, and returns are favorable, and leverage reduced. The two aspects to watch out for include the extremely high liquidity ratio (Current Ratio close to 4.8 times and Cash Ratio exceeding 1.0 time), which means that money is probably being accumulated more quickly than its productive use, and the reduction in equity turnover, meaning that the sales are not growing in proportion to the equity.

Du Pont Analysis

Du Pont Analysis of Kohinoor shows that ROE is broken down into Net Profit Margin, Asset Turnover, and Equity Multiplier over 2021–2025 years (the year 2020 excluded – please refer to the note below). The most powerful factor driving ROE increase has been Net Profit Margin. It has increased every year, without exception, from 5.62% in 2021 to 6.73% (2022), 7.04% (2023), 8.80% (2024) to 9.77% in 2025 – almost doubling over the period. Asset Turnover ratio remained in the middle of the scale but with some fluctuations, decreasing slightly from 1.83x (2021) to 1.69x (2023) but then recovering up to 1.81x (2024) and 2.02x (2025) – which means that margins' growth but not efficiency of assets have been the drivers of increasing returns, at least until 2025. Equity Multiplier took the opposite direction and decreased every year from 2.06 (2021).

In other words, Du Pont's ROE has remained in the small range of 0.21-0.23 from 2021 to 2024 before rising sharply to 0.28 in 2025. In view of the fact that the Equity Multiplier has been declining during the same period, this increase in ROE, particularly in 2025, is due to increased profitability rather than increased leverage since an increase in net profit margin (which has gone up by almost a full point in the year 2025 alone) has been more than compensating for the negative effects of decreased leverage.

Note: 2020 has been left out of this part since Asset Turnover and Du Pont return on equity for 2020 cannot be calculated on an average total assets basis without knowing the total assets of 2019, which was unavailable during the calculation.

Investment Summary

Valuation Methods

Our methodology for the valuation was Discounted Cash flow and Relative Approach. We conducted 4 valuation models to determine target price range using Geometric mean and the weighted average of the different fair values under the 4 models. The models we used are

Dividend Discount approach using Gordon Growth Model. Moreover, we have conducted P/E MMM, FCF, FCFF and FCFE models

Kohinoor Chemicals' total debt remained mostly stable at around ₹326 million through the years, except in the year of 2023, when its debt reached the unexpected amount of ₹1.08 billion following a significant increase in its borrowing. Kohinoor also experienced enormous rise in its interest expense of up to ₹41.7 million. The Implied Cost of Debt of the company is questionable since it is calculated on the basis of a net debt indicator, which is negative in this case in most years due to the positive cash position of Kohinoor (the company is holding more cash than debt). It can be noted that Kohinoor produced distorted values of Implied Cost of Debt such as -8.49% (2020) and 39.86% (2021). The only year when the net debt is positive, that is 2025, is the year when Kohinoor is evaluated to have a proper indicated of 2.45%. The other way to assess this metric is through the calculation of interest expense to gross debt ratio, which shows the result of 2.09% (2020), rising to 8.10% (2024) during the period of increased borrowing and easing to 1.51% in the future.

Cost of Equity:

Current Share Price	533.1
Current Dividend, Divo	4.08
Growth Rate,g	13.18%
Cost of Equity, ke	14.05%

Kohinoor Chemicals has its cost of equity calculated in accordance with the Dividend Discount Model (DDM or Gordon Growth Model) to arrive at 14.05%. This calculation uses the present stock price of P_0 of P_f and 14.05%. $D_0 = 4.08$ (average cash dividends) and growth rate coming out to be 13.18%. As per the formula, the dividend yield component accounts for about 0.87%. The majority of the return is based on the growth rate, which is 13.18%. Hence the return from expected dividends is based primarily on growth rather than yield. This is indicative of the fact that investors expect growth in dividends than current yield from the stock. This is typical for a company where retention of profit occurs.

WACC

Cost of Debt	2.45%
Cost of Equity	14.05%
Debt	441,378,370
Equity	21,739,818,000
Market Value	22,181,196,370
Tax Rate	27.69%
WACC	13.80%

The WACC for Kohinoor Chemicals amounts to about 13.80%. The computation involves the use of total debt at the level of ₹441,378,370 and the market value of equity at the level of

roughly ₹21,739,818,000. This leads to the combined market value of the company being recorded at approximately ₹22,181,196,370. This leads to the emergence of the capital structure that is largely equity-based (with equity financing gaining about 98.01% as opposed to only 1.99% represented by debt). The WACC comes into play thanks to the application of after-tax cost of debt (2.45% cost of debt, adjusted for a 27.69% tax rate) and the cost of equity at the level of 14.05%, leading to quite a limited contribution of debt amounting to just about 0.04% and the equity amounting to the majority of WACC that is 13.80%.

Free Cash Flow

Kohinoor's Free Cash Flow (FCF) is derived from Net Operating Earnings by making adjustments to working capital. It means that we need to decrease accounts receivable, increase inventory, and increase accounts payable and accrued expenses to arrive at Net Cash Provided by Operating Activities. At this point, investing activities are added, including the proceeds from sales and purchases of assets or equipment, income in the form of dividends, and cash holdings in financial instruments. These adjustments will constitute Net Cash Used in Investing Activities. By summing up cash flows from operations with cash flows from investing, we will calculate Free Cash Flow before Interest Adjustment. Finally, After-tax Add-back and Add-back Interest values will be added to attain adjusted Free Cash Flow.

	2025	2024	2023	2022	2021	2020

Kohinoor has experienced significant fluctuations in free cash flow from previous years, from financial highs of around ₹1.17 billion as seen in 2024, to financial lows of just about ₹262.7 million as seen in one year after in 2025, not forgetting even the negative cash flows recorded earlier on in 2023 (-₹59.5 million). Such volatile cash flow experienced during 2025 can mainly

be attributed to such factors as the large outflows of a whopping ₹404.8 million to fixed deposit receipts, a significant reduction in accounts receivables, and further large outflows pertaining to investments that were valued at about -₹401.5 million. This massive fluctuation in free cash flow notwithstanding, operating profits always seem to grow each successive year since they have gradually increased from the previous ₹168 million back in 2020 to around ₹632 million in 2025. However, it is evident that the volatility of current assets and aggressive investments have continued to affect the financial flows of the company indicating how the company seems to reinvest most of its money earned instead of keeping it..

FCF Valuation Model

Valuation of Kohinoor (FCF Model)				
Year		FCF		
2025		262,743,560.00		
Perpetual growth rate		4%		
WACC		13.80248962		
Growth		13.17983656		
FCF Value (years 1–5): = Base FCF × (1+Growth) ⁿ				Terminal value
# of year	Year	FCF Value		Total FCF
1	2026	297373161		297373161
2	2027	336566944		336566944
3	2028	380926467		380926467
4	2029	431132575		431132575
5	2030	487955849		5666262816
Terminal Value at year 5-		5666262816

No. Of shares-		40,780,000		
Stock price-		109.0387063		
Market value		533.1		

The FCF model discounts Kohinoor's projected free cash flow, starting from a 2025 base of ₹262,743,560 and growing at 13.18% through 2030, with a 4% perpetual growth rate applied for the terminal value. Discounting at Kohinoor's WACC of 13.80% produces a Net Present Value of ₹4,005,220,073. Adding total debt of ₹441,378,370 gives an Equity Value of ₹4,446,598,443, which — divided by 40,780,000 shares — yields an intrinsic stock price of ₹109.04. Compared to the current market price of ₹533.10, this indicates Kohinoor is trading well above its FCF-derived intrinsic value, suggesting the stock is overvalued.

Equity Value	6122822339				
No. Of shares-	40,780,000				
Stock price-	150.1427744				
Market value	533.1				

FCFF valuation methodology determines the value of Kohinoor by discounting cash flow that can be received by all capital providers including debt and equity holders using the weighted

average cost of capital (WACC). The valuation methodology assumes ₹372,704,352.80 as the base FCFF for 2025 and forecasts the FCFF by taking into account the explicit growth rate of 13.18% until 2030 when the terminal value is determined on the basis of 4% perpetual growth rate (FCFF in 2030 is equal to ₹7,345,479,931). Discounting FCFF at WACC of 13.80% results in Net Present Value of ₹5,681,443,969. Adding ₹441,378,370 to Net Present Value provides Equity Value of ₹6,122,822,339 or ₹150.14 per

FCFE Valuation Model

Valuation of Kohinoor (FCFE Model)				
Year	FCFE			
2025	359,266,409.00			
Perpetual growth rate	4%			
WACC	13.80248962			
Growth	13.17983656			
FCF Value (years 1–5): = Base FCF × (1+Growth)^n			Terminal value	7080636910
# of year	Year	FCFF Value		Total FCFF
1	2026	406581795	297373161	
2	2027	460209937	336566944	
3	2028	520865607	380926467	
4	2029	589515694	431132575	
5	2030	667213863	7747850773	
Terminal Value at year 5- 7718450199				
NPV-	5425014682			
Equity Value	5425014682			
No. Of shares-	40,780,000			
Stock price-	133.0312575			
Market value	533.1			

Starting from a 2025 base FCFE of ₹359,266,409, the model projects FCFE forward at Kohinoor's 13.18% growth rate through 2030, then applies a 4% perpetual growth rate for the terminal value. Discounting these cash flows produces a Net Present Value — and here, unlike the FCFF model, that NPV *is* the Equity Value directly (no debt bridge needed, since FCFE is already a levered/equity cash flow) — of ₹5,425,014,682. Divided by 40,780,000 shares, that gives an intrinsic stock price of ₹133.03, well below the ₹533.10 market price.

P/E Valuation

Using PE MMM Valuation			
EPS	17.05	MKT Price	533.1
Kohinoor P/E	31.26686		
Industry P/E	62.09		
	Intrinsic Value		1058.635

The trailing PE ratio for Kohinoor has been 31.27x and the average for the pharmaceutical and chemical industry is quite high at 62.09x — considerably skewed by outliers such as IBP (611x) and AMBEEPHA (251x) with no earnings. By applying this inflated industry multiple to Kohinoor's EPS (Tk 17.05), an intrinsic value of Tk 1,058.64 is obtained — almost double the current market price of Tk 533.10.

This indicates that Kohinoor seems to be undervalued based on the P/E MMM analysis, though, this conclusion should be treated with caution: the fact that this industry average was inflated by extreme outliers rather than being in line with the truth signifies that the figure of Tk 1,058.64 inflates the fair value. A more justified metric could use sector median (approximately 25.43x) or outlier-adjusted average (approximately 30.87x), which would result in Kohinoor's intrinsic value being significantly closer to its current market value, indicating that its share price is fairly valued rather than undervalued.

DDM Gordon Model:

Kohinoor's DDM model indicates that earnings per share will increase from ₳7.36 in 2026 to ₳12.07 in 2030 as net profit will rise from ~₳699.4 million to ~₳1.05 billion in the same period based on 40.78 million shares. Putting a discounted value to these earnings plus a terminal value of ₳123.15 in 2030, I arrive at an intrinsic value per share of ₳102.93 which is way below the market price of ₳533.10 indicating that the stock is currently trading around 5.2 times its DDM-derived intrinsic value implying that the market either assesses much stronger earnings growth that has not yet been incorporated into the model or other factors contribute to the valuation, or the assumptions of the model (growth and discount rates) do not hold the potential to represent the earnings potential of the company properly resulting in a distorted inflated valuation of the stock based solely on the DDM approach.

DDM Gordon Model					
	1	2	3	4	5
Year	2026	2027	2028	2029	2030
Net Profit	699391424.22	773946550.04	856449252.28	947746742.57	1048776545.33
Dividends	300005792.78	339546065.95	384297682.49	434947488.96	492272857.14
Shares	40,780,000	40,780,000	40,780,000	40,780,000	40,780,000

CF	7.356689377	8.326289013	9.423680297	10.66570596	135.2179866
Intrinsic Value					
102.929394					
Market Price					
533.1					

Conclusion:

Operating fundamentals of Kohinoor Chemical remain robust as being the second largest domestic FMCG business with protective barriers of import substitution duties and growing demand from middle class, the company managed to achieve solid margin growth along with growth of ROE (22.76% → 28.41%) and ROA (11.93% → 19.77%) for period of 2023-2025, owing to real profit improvement instead of debt increase that, on contrary, decreased.

Valuation of the company, however, paints a different picture. Out of four applied models three (FCF (₹109.04), FCFF (₹150.14), FCFE (₹133.03) and DDM (₹102.93)) yield intrinsic values 72–81% lower compared to the ₹533.10 current share price and thus overvaluing the company. The sole exception to this pattern – P/E MMM (₹1,058.64), suggesting undervaluation – is not reliable since it uses industry multiple distorted by two outlier companies (IBP at 611x and AMBEEPHA at 251x) and thus should be adjusted to be closer to DCF cluster.

Weighting according to reliability, the cash flow models clearly point out that the share price of Kohinoor Chemical is overvalued due to non-quantifiable reasons (legacy of brand, stability of dividends, rarity on DSE).
